

Digital Skills

- connect & collaborate
- Make better decisions
- Innovate
- Focus on inspiring & creative stories

Digitisation of

- 1.7 Data
- 2.7 Technology
- 3.7 Ways of working

1.7 Data

- unorganised pile of information
- organisations work on flow/exchange of data

Advanced Data Analytical techniques can even create new data from patterns in existing information

based on data from activities of the users ML Predict preferences. Basically user itself generate new data & system incorporate it.

2.4 Technology

↳ Cloud → on-demand computing power & storage
accessed through internet

Media Streaming
Platforms

Collaborative Working

↳ AI → machines programmed to imitate human intelligence.
→ Generative AI tools are capable of creating new & diverse
content such as text, images, videos, music, code, and even
3D models.
→ they can help with workflow management,
complex problem-solving, personalised learning

↳ Connected devices

↳ Physical devices that use internet to connect with each
other

↳ Advances in connected infrastructure like
lane detection; road traffic sensors and smart
signage → enables autonomous cars to share
live data with each other easing traffic
↳ decrease accidents

Example of tech. involved in finding nearest grocery store

1.4 Biometrics

3.4 Cloud

5.4 AI & ML

2.4 NLP

4.4 Connected devices

6.4 RPA (Robotic Process Automation)

RPA → technology that uses software to automate repetitive processes
↳ an RPA application can open & control other applications to pull information from websites, then copy & consolidate data into new locations, send emails & handle other tasks

3.7 Ways of Working

- Design thinking

↳ creative & innovative approach centered at deep understanding of end users need & problems they face

→ Identifying Correct End User

→ Solving Right Problem

Agile Ways of Working

- focus on End Users :- regular feedback loops to get insights of needs & problems

- Be team oriented

- Drive Continuous Value $\{ 1.1^x \gg \gg x^2 \}$

- Iterative & Learn Quick

↳ Work in Short test-and-learn cycles to create right product & remaining flexible all while

Generative AI

1. Medical Science
2. Manufacturing
3. Media & design
4. Finance

Not only analyse data patterns to predict decisions but also create new content

Agentic AI

"human-like" capabilities i.e. like a co-worker able to collaborate with you

reason, interpret & make independent decisions.

It is like You set a Goal → then digital co-workers do the work

Gen AI → "tell or show me"

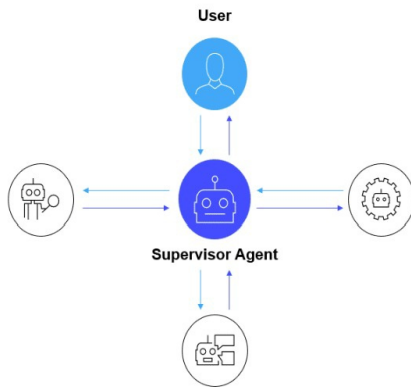

- ↳ more towards content creation
- ↳ Need human guidance & interaction for multi-step work

Agentic AI → "do it for me"

- ↳ Reason & choose next step
- ↳ Remember past tasks
- ↳ Use tools independently to process data
- ↳ Plan, make decisions & execute
- ↳ adapt & learn from environment

...to automation of a complete process via multi-agent workflows

Example: a user wants to automate a daily social media update for their organization.

1. Research Agent

- Gathers trending news and articles in the company's industry
- Delivers 3–5 key items as a summary list

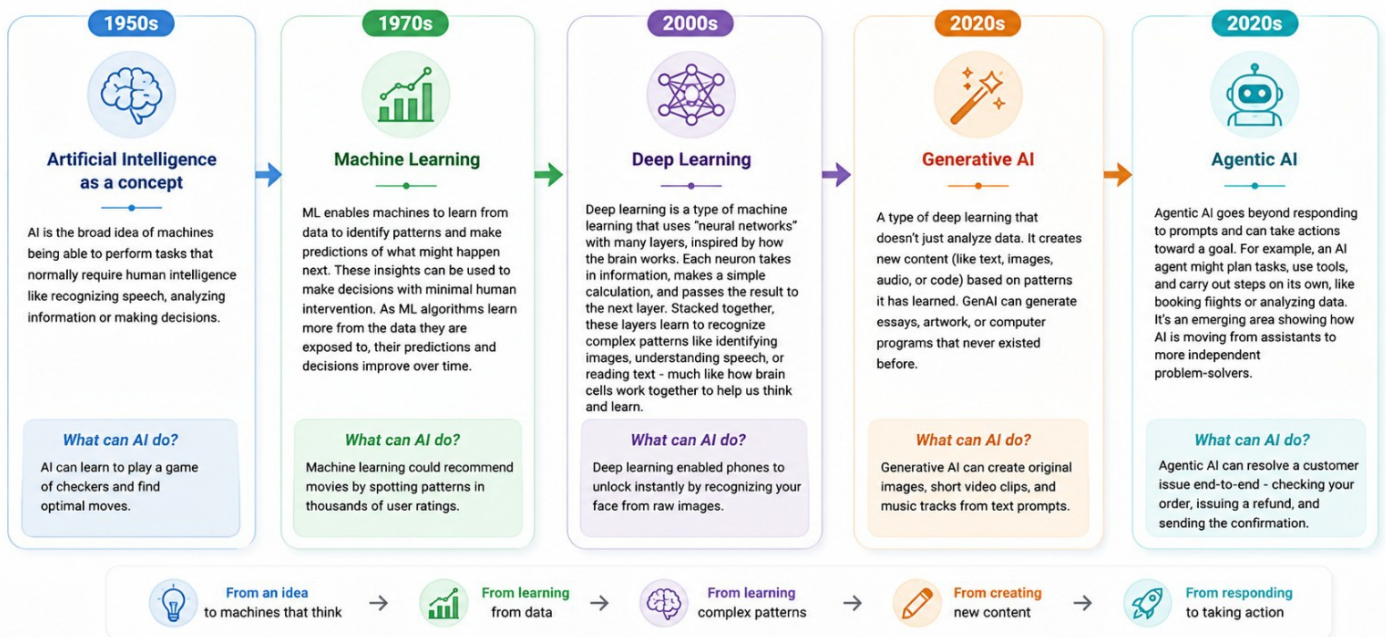

2. Content Agent

- Turns the summary into draft posts (e.g., LinkedIn, Twitter, Instagram)
- Adjusts tone for each platform (professional, conversational, visual)

3. Review Agent

- Checks grammar, tone, and brand voice
- Flags anything risky (e.g., sensitive topics or unverified claims)

The Evolution of AI

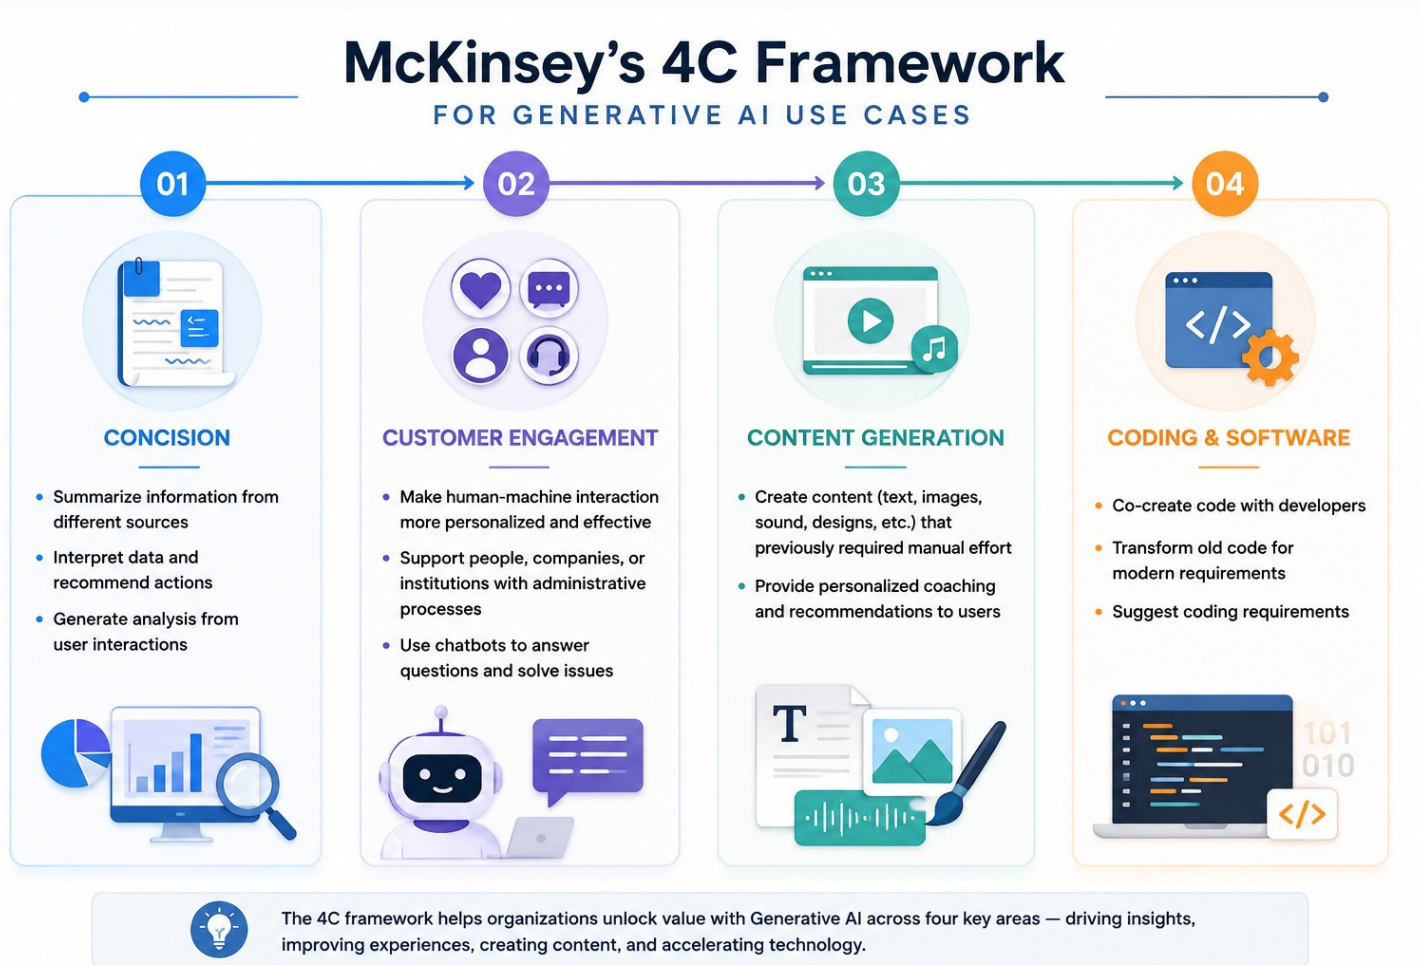

Gen AI is "predictive" not "deterministic"

LLMs → AI model trained on huge amounts of text from books, websites & other sources. By learning patterns in lang., it can predict what words are likely to come next in a sentence. This allows it

to generate responses that sound natural

Gen AI use cases

★

With Gen AI, it requires human judgment to decide when it is required to rely on your own expertise or traditional methods; or when Gen AI is the right tool.

❌ Tasks to Avoid (Unsuitable)

1. Accuracy is critical

Don't rely on AI for tasks that require precise facts, numbers, or legal details.

E.g., calculating tax payments.

2. Fresh, real-time info

AI may be outdated or hallucinate when asked about today's news or markets.

E.g., what law passed yesterday?

3. Sensitive or confidential content

Avoid sharing private or sensitive data you wouldn't share with an outsider, or that could jeopardize someone's privacy rights.

E.g., copying internal strategy documents, confidential business information, or PII into a Gen AI tool.

4. High-stakes decisions

Don't use AI alone for medical, financial, or legal choices.

E.g., should I change my medication?

5. Structured, rule-based processes

Spreadsheets, calculators, or databases do these jobs better and more reliably.

E.g., payroll calculations.

✅ Tasks to Use (Suitable)

1. Exploratory, not definitive

Use AI when you want ideas, drafts, or options, not a single "truth".

E.g., brainstorm three ideas for a campaign.

2. Creative & language-based

Great for anything involving words, communication, or brainstorming.

E.g., rewrite an email to sound more professional.

3. Good starting point

Great for first drafts you'll refine further.

E.g., draft a blog post outline.

4. Productivity shortcuts

Apply AI to repetitive or tedious tasks to free up time for higher-value work.

E.g., reformat meeting notes.

5. Human-in-the-loop

Works best when paired with your review, judgment, and edits.

E.g., use AI to draft slides, then review them yourself.

Use AI thoughtfully—excel at what AI is good at, and keep humans in control where it matters most.

Prompting Basics

key elements must in a prompt

1.7 Task

2.4 Context

3.7 Output format

providing more context is the best way to get more accurate, relevant results

→ Examples

→ Personas → asking Gen AI to analyse a problem from the perspective of a particular person (ie role of character; - eg:- financial analyst, CEO, Marketing Manager, etc)

→ Tone → style of response

Gen AI is not only a conversation tool but also
1. Design & Publish an entire website & app

- Cursor
- Lovable
- Replit

2. Generate images, videos, or even synthetic voices

- Dall-E
- Fliki

3. Streamlining & Automating tasks like emailing or scheduling

- Zapier
- Make
- n8n

How to Work Smarter with Gen AI

• Tips to Get the Most Value •

01

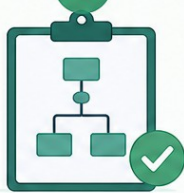

Use Gen AI as a thought partner

Problem solving works better when you have a partner to think with. Gen AI can help you test your problem statement, brainstorm possible causes, and test your ideas. You can even ask it to challenge your thinking by giving it various personas to test your ideas from multiple perspectives (e.g., act as my CEO or an expert in a certain topic).

Bonus tip!

Ask it to act as a "challenger," to critique your ideas and uncover new angles you may not have considered.

02

Use Gen AI to strengthen structure

Gen AI is great at bringing structure to messy ideas. You can use it to outline an issue tree, check whether your structure is MECE (mutually exclusive, collectively exhaustive), or build a logical workplan.

Bonus tip!

Give it an example of how exactly you want the output format to look.

03

Use Gen AI to support research and analysis

While you remain in charge of judgment and quality, Gen AI can speed up research and analysis. For example, it can conduct deep research, summarize large documents, suggest ways to clean or structure data, generate first-cut charts, or brainstorm possible explanations for trends.

Bonus tip!

If relevant, use a tool that lets you upload reference material, ensuring your data stays private and isn't used to train models, so the research and analysis come directly from your own knowledge base.

04

Use Gen AI to strengthen your messaging

Great problem solving is not just about analysis, but also about communication. Gen AI can help you adapt your message for different audiences, simplifying complex points for non-specialists, making content concise for senior leaders, or adjusting tone for clients vs. teammates.

Bonus tip!

Use a tool that lets you record yourself giving your presentation and get direct feedback on how you delivered it.

4

Remember: Gen AI is a powerful ally — but your judgment, expertise, and ethics lead the way.

The use of Gen AI has risks associated with it :-

1. Bias analysis
2. Inaccuracy → generate false, misleading or nonsensical information i.e. hallucinate
3. Privacy → might misuse personal or sensitive info without permission
4. Harmful Use → it can be wrongly used to create harmful content such as fake news or offensive material

So, Human-involvement is still needed to

How can you manage these risks?

- **Think critically:** Evaluate inputs and outputs carefully, always ask for sources and cross-check facts
- **Be aware of bias:** Learn about AI bias and how to identify it
- **Be aware of laws and regulations:** Learn about local AI laws and regulations that could impact how you use AI tools
- **Protect data:** Follow your organization's policy on sharing personal or customer data with AI and use only approved AI tools
- **Verify everything:** Don't take AI at face value. Enhance your digital literacy to better distinguish real and fake content and use techniques like reverse image searching for verification
